THE INDUSTRY LEADER IN TIP TECHNOLOGY

Airless spray tips are a key component to the successful operation of an airless spray system. They define the spray pattern, control the flow, atomize the coating and ultimately tell the pump how hard it must work. A proper understanding of airless tips is critical to the success of any airless application.

Tip Characteristics

It is important to remember that the orifice size, in conjunction with the fan-width, determines the spray characteristics of the tip.

Tip Wear

When beginning a project, choosing the right tip size and fan width will determine both coating consumption and production time. If the tip size is wrong — either by choice or through wear — mil thicknesses will be too heavy and the finish will be unprofessional.

The spray pattern chart demonstrates what happens as a tip wears. As wear occurs, the pattern size decreases and the orifice size increases. You will have to make more passes to cover the same area. There is no standard rate of tip wear due to the variation of the abrasiveness of all coatings.

Examples for Understanding Airless Tips

Example A:

The larger the orifice with the same fan width, the greater the volume of paint applied to the area.

Fan Width:	10"	10"	10"
Orifice Size:	.017	.021	.027
Tip Number:	517	521	527
	Least Volume	More Volume	Most Volume

Example B:

The larger the fan width with the same orifice means the same amount of material is being applied over a greater area. The result is less volume of paint per square inch.

Fan Width:	8"	12"	16"
Orifice Size:	.017	.017	.017
Tip Number:	417	617	817
	Narrow Fan	Medium Fan	Large Fan

A FITTING FOR EVERY JOB

Spraying is more than just hooking up a hose. Sometimes the situation calls for extending hose length or altering the angle of the hose connected to the sprayer. That's when you need Titan manifolds and fittings. Our fittings are manufactured from quality carbon steel and plated for maximum corrosion resistance.

3M® PPS™ Paint Preparation System

3M PPS Paint Preparation System is a unique, closed paint system that eliminates the need for separate mixing cups and filters. Instead, paint is mixed in a liner bag which marries to a direct filter and is then mounted on the spray gun with a dedicated adapter.

- As freshly-filtered paint is dispensed, the liner bag collapses, allowing the spray gun to function at any angle.
- Liner bag and filter are disposable, leaving only the spray gun and adapter to be cleaned.
- 3M PPS Paint Preparation System is a cleaner, faster system, safe from outside contamination and offers considerable time and solvent savings on gun and parts cleaning.
